

ANTI-WRINKLE TREATMENTS

By: Dr. Yvonne Finlay

Anti-wrinkle Injections

- Injecting small amounts of Botulinum toxin (Botox) into target areas can prevent new lines, soften existing lines and create “lift” and “drop” effects.
- The most commonly treated areas are frown lines, forehead lines, and crows feet.
- Effects last 3 to 4 months.

Excessive Sweating (Hyperhidrosis) Treatment.

- Hyperhidrosis (excessive sweating) is a common problem yet is undertreated due to lack of awareness, and its embarrassing nature.
- It can be effectively treated by injecting small amounts of Botulinum toxin directly into each underarm.
- The sweating is dramatically reduced with effects lasting 6 to 8 months.

Dermal Filler.

- Dermal Filler is used to smooth and soften lines, and restore lost facial volume, in the mid and lower face.
- Areas commonly treated are nose-to-mouth, around the mouth, lips and cheeks
- Effects last 6 to 12 months
